

# Kansas Biological Survey

Serving the needs of the entire state

The Kansas Biological Survey's work is grounded in its historic studies of state flora and fauna dating back to 1866. It formally became part of the University of Kansas and, in addition, gained State agency status in 1959. As both a KU research center and a State agency, the Survey serves all of Kansas. Research and activities focus on clean and plentiful water supply; sustainable land management; assessment of development sites; plant and animal species populations; and more. We are ready to provide information needed by landowners, businesses and government entities.

Clockwise from top left: Preparation for research of harmful algal bloom, Milford Reservoir; pollinator inventory at a private property near Topeka; geographic information system (GIS) mapping and research of water usage, vegetation cover and flood events; examining sediment composition on the Cottonwood River.

For more information about the Kansas Biological Survey, or to speak with a research staff member about your needs or those of your community or municipality, please visit our website, or contact us at [biosurvey@ku.edu](mailto:biosurvey@ku.edu) or 785-864-1500.
